QUESTION 1

Your company has a main office and a remote office. The remote office is used for disaster recovery. The network contains an Active Directory domain named contoso.com. The domain contains member servers named Server1, Server2,

Server3, and Server4. All servers run Windows Server 2012 R2.

Server1 and Server2 are located in the main office. Server3 and Server4 are located in the remote office.

All servers have the Failover Clustering feature installed. The servers are configured as nodes in a failover cluster named Cluster1. Storage is replicated between the main office and the remote site.

You need to ensure that Cluster1 is available if two nodes in the same office fail. What are two possible quorum configurations that achieve the goal? (Each correct answer presents a complete solution. Choose two.)

- A. No Majority: Disk Only
- B. Node Majority
- C. Node and File Share Majority
- D. Node and Disk Majority

Correct Answer: AB

Depending on the quorum configuration option that you choose and your specific settings, the cluster will be configured in one of the following quorum modes:

*

(A) No majority (disk witness only)

*

(B) Node majority (no witness)

*

Node majority with witness (disk or file share)

QUESTION 2

You have a DHCP server named Server1 that runs Windows Server 2012 R2. You need to configure Server1 as a stateless DHCPv6 server. Which cmdlet should you run?

- A. Add-DHCPserv6Scope
- B. Add-DHCPserv6OptionDefinition
- C. Set-DHCPserv6Class

D. Set-DHCPServerv6OptionValue

Correct Answer: D

The parameters Parent Domain and IPv6 DNSServer, which the installation wizard asked for during the DHCP server role installation if you chose "enable stateless mode," can be added manually to the Server Options node in the DHCP management console.

The Set-DhcpServerv6OptionValue cmdlet sets anIPv6 option value at the server, scope, or reservation level.

<https://4sysops.com/archives/the-difference-between-stateless-and-stateful-mode-of-a-windows-server-2008-r2-dhcpv6-server/>

QUESTION 3

Your network contains an Active Directory domain named contoso.com. The domain contains a domain controller named DC1 and a member server named Server1. All servers run Windows Server 2012 R2.

You install the IP Address Management (IPAM) Server feature on Server1.

From the Provision IPAM wizard, you select the Group Policy Based provisioning method and enter a GPO name prefix of IPAM1.

You need to provision IPAM by using Group Policy.

What command should you run on Server1 to complete the process?

To answer, select the appropriate options in the answer area.

Hot Area:

Answer Area

Import-Gpo
Invoke-IPAMGpoProvisioning
Invoke-IPAMServerProvisioning

-Domain Contoso.com
-Server Server1.contoso.com
-TargetName Dc1.contoso.com

-GpoPrefixName Ipam1

Correct Answer:

The Invoke-IpamGpoProvisioning cmdlet creates and links three group policies specified in the Domain parameter for provisioning required access settings on the server roles managed by the computer running the IP Address Management (IPAM) server. Reference: Invoke-IpamGpoProvisioning

QUESTION 4

Your network contains an Active Directory domain named contoso.com. The domain contains two servers named Server1 and Server2. Both servers have the IP Address Management (IPAM) Server feature installed.

You have a support technician named Tech1. Tech1 is a member of the IPAM Administrators group on Server1 and Server2.

You need to ensure that Tech1 can use Server Manager on Server1 to manage IPAM on Server2.

To which group on Server2 should you add Tech1? To answer, select the appropriate group in the answer area.

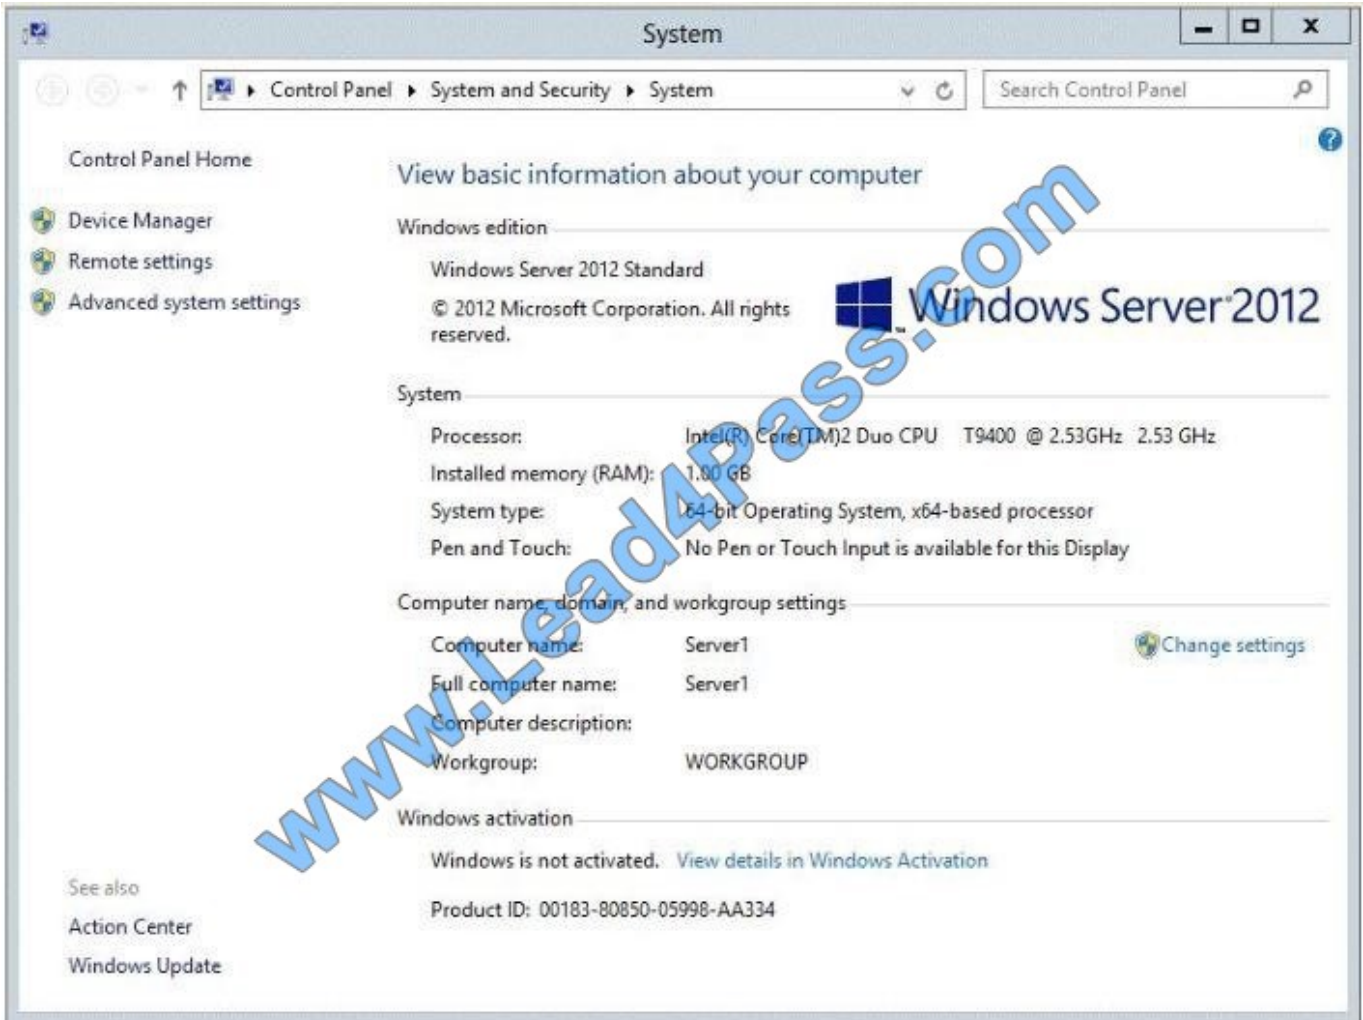

- A. IPAM MSM Administrators
- B. Remote Management Users
- C. WinRMPemoteWMNIUsers_
- D. IPAM Administrators

Correct Answer: C

If you are accessing the IPAM server remotely using Server Manager IPAM client RSAT, then you must be a member of the WinRMRemoteWMIUsers group on the IPAM server, in addition to being a member of the appropriate IPAMsecurity group (or local Administrators group).

QUESTION 5

Your network contains an Active Directory domain named contoso.com. The domain contains a server named Server1 that runs Windows Server 2012 R2. The system properties of Server1 are shown in the exhibit. (Click the Exhibit button.)

You need to configure Server1 as an enterprise subordinate certification authority (CA). What should you do first?

- A. Add RAM to the server.
- B. Set the Startup Type of the Certificate Propagation service to Automatic.
- C. Install the Certification Authority Web Enrollment role service.
- D. Join Server1 to the contoso.com domain.

Correct Answer: D

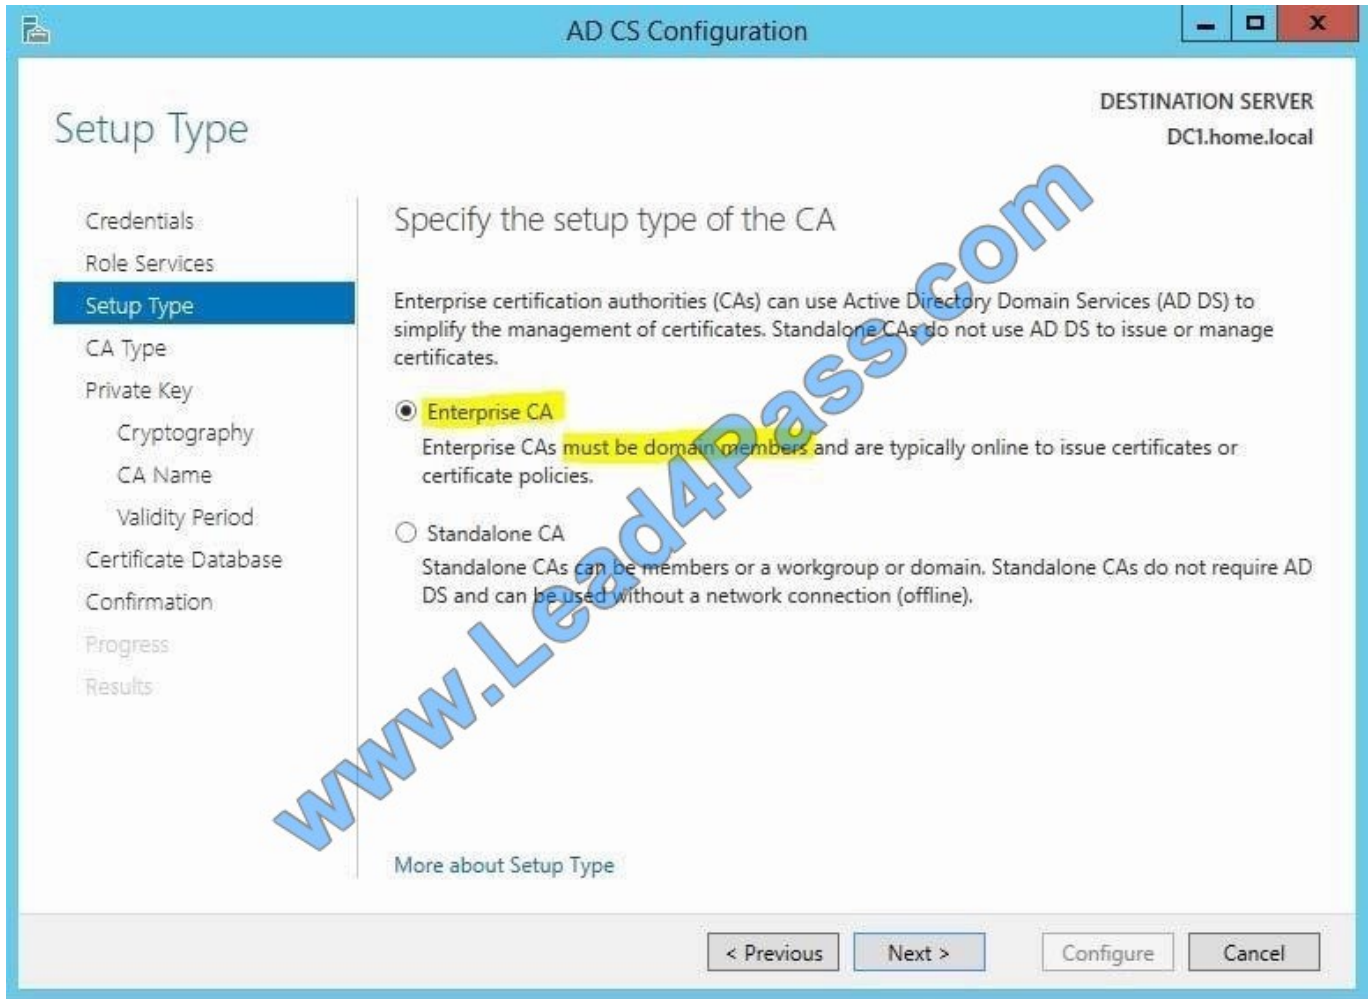

Enterprise CAs must be domain members. From the exhibit we see that it is only a Workgroup member.

Note:

A new CA can be the root CA of a new PKI or subordinate to another in an existing PKI.

Enterprise subordinate certification authority.

An enterprise subordinate CA must get a CA certificate from an enterprise root CA but can then issue certificates to all users and computers in the enterprise. These types of CAs are often used for load balancing of an enterprise root CA.
