QUESTION 1

You have a server named Server1.

You install the IP Address Management (IPAM) Server feature on Server1.

You need to provide a user named User1 with the ability to set the access scope of all the DHCP servers that are managed by IPAM. The solution must use the principle of least privilege.

Which user role should you assign to User1?

- A. DNS Record Administrator Role
- B. IPAM DHCP Scope Administrator Role
- C. IP Address Record Administrator Role
- D. IPAM DHCP Administrator Role

Correct Answer: D

The IPAM DHCP administrator role completely manages DHCP servers.

QUESTION 2

You have a server named Server1 that runs Windows Server 2012 R2.

A Microsoft Azure Backup of Server1 is created automatically every day.

You need to view the items that are included in the backup.

Which cmdlet should you run?

- A. Get-WBSummary
- B. Get-WBFileSpec
- C. Get-WBJob
- D. Get-OBFileSpec

Correct Answer: D

QUESTION 3

Your network contains an Active Directory forest named adatum.com. The forest contains a single domain. The domain contains four servers. The servers are configured as shown in the following table.

Server name	Configuration	Operating system
DC1	<ul style="list-style-type: none">• Global catalog server• Domain controller• Schema master• DNS server	Windows Server 2003 R2
DC2	<ul style="list-style-type: none">• Domain controller• PDC emulator• DHCP server• DNS server	Windows Server 2003 R2
DC3	<ul style="list-style-type: none">• Infrastructure master• Global catalog server• Domain controller• WINS server	Windows Server 2008 R2
Server1	<ul style="list-style-type: none">• Member server• WINS server• DNS server	Windows Server 2003 R2

You need to update the schema to support a domain controller that will run Windows Server 2012 R2. On which server should you run adprep.exe?

- A. Server1
- B. DC3
- C. DC2
- D. DC1

Correct Answer: B

We must use the Windows Server 2008 R2 Server. Upgrade Domain Controllers to Windows Server 2012 R2 and Windows Server 2012 You can use adprep.exe on domain controllers that run 64-bit versions of Windows Server 2008 or Windows Server 2008 R2 to upgrade to Windows Server 2012. You cannot upgrade domain controllers that run Windows Server 2003 or 32

bit versions of Windows Server 2008. To replace them, install domain controllers that run a later version of Windows Server in the domain, and then remove the domain controllers that Windows Server 2003.

QUESTION 4

You have a server named Server1 that runs Windows Server 2012 R2. Server1 is located in the perimeter network and has the DNS Server server role installed.

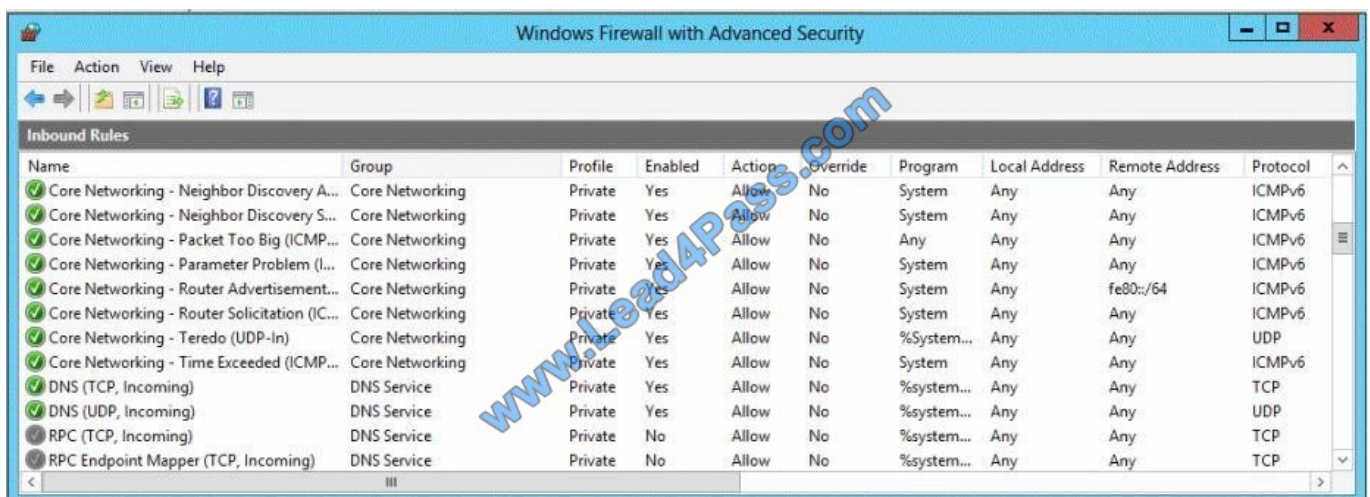

Server1 has a zone named contoso.com.

You App1y a security template to Server1.

After you App1y the template, users report that they can no longer resolve names from contoso.com. On Server1, you open DNS Manager as shown in the DNS exhibit. (Click the Exhibit button.)

On Server1, you open Windows Firewall with Advanced Security as shown in the Firewall exhibit. (Click the Exhibit button.)

You need to ensure that users can resolve contoso.com names.

What should you do?

A. From Windows Firewall with Advanced Security, disable the DNS (TCP, Incoming) rule and the DNS (UDP,

Incoming) rule.

B. From DNS Manager, modify the Zone Transfers settings of the contoso.com zone.

C. From DNS Manager, unsign the contoso.com zone.

D. From DNS Manager, modify the Start of Authority (SOA) of the contoso.com zone.

E. From Windows Firewall with Advanced Security, modify the profiles of the DNS (TCP, Incoming) rule and the DNS (UDP, Incoming) rule.

Correct Answer: E

To configure Windows Firewall on a managed DNS server

On the Server Manager menu, click Tools and then click Windows Firewall with Advanced Security.

Right-click Inbound Rules, and then click New Rule. The New Inbound Rule Wizard will launch.

In Rule Type, select Predefined, choose DNS Service from the list, and then click Next.

In Predefined Rules, under Rules, select the checkboxes next to the following rules:

-RPC (TCP, Incoming)

-

DNS (UDP, Incoming)

-

DNS (TCP, Incoming)

-RPC Endpoint Mapper (TCP, Incoming)

Click Next, choose Allow the connection, and then click Finish.

Right-click Inbound Rules, and then click New Rule. The New Inbound Rule Wizard will launch.

QUESTION 5

Your network contains an Active Directory domain named contoso.com. The domain contains two servers named Server1 and Server2 that run Windows Server 2012 R2. The servers have the Hyper-V server role installed.

A certification authority (CA) is available on the network.

A virtual machine named vml.contoso.com is replicated from Server1 to Server2. A virtual machine named vm2.contoso.com is replicated from Server2 to Server1.

You need to configure Hyper-V to encrypt the replication of the virtual machines.

Which common name should you use for the certificates on each server?

To answer, configure the appropriate common name for the certificate on each server in the answer area.

Hot Area:

Server name	Common name
-------------	-------------

Server1	<input type="text"/> server1.contoso.com server2.contoso.com vm1.contoso.com vm2.contoso.com
Server2	<input type="text"/> server1.contoso.com server2.contoso.com vm1.contoso.com vm2.contoso.com

Correct Answer:

Server name	Common name
-------------	-------------

Server1	<input type="text"/> server1.contoso.com server2.contoso.com vm1.contoso.com vm2.contoso.com
Server2	<input type="text"/> server1.contoso.com server2.contoso.com vm1.contoso.com vm2.contoso.com

Hyper-V Replica Certificate Requirements

If you want to use HTTPS, then you will need to create certificates for the hosts/clusters in both the primary and secondary sites.
