QUESTION 1

HOTSPOT

Your network contains an Active Directory domain named contoso.com. The domain contains a server named Server2 that runs Windows Server 2012 R2.

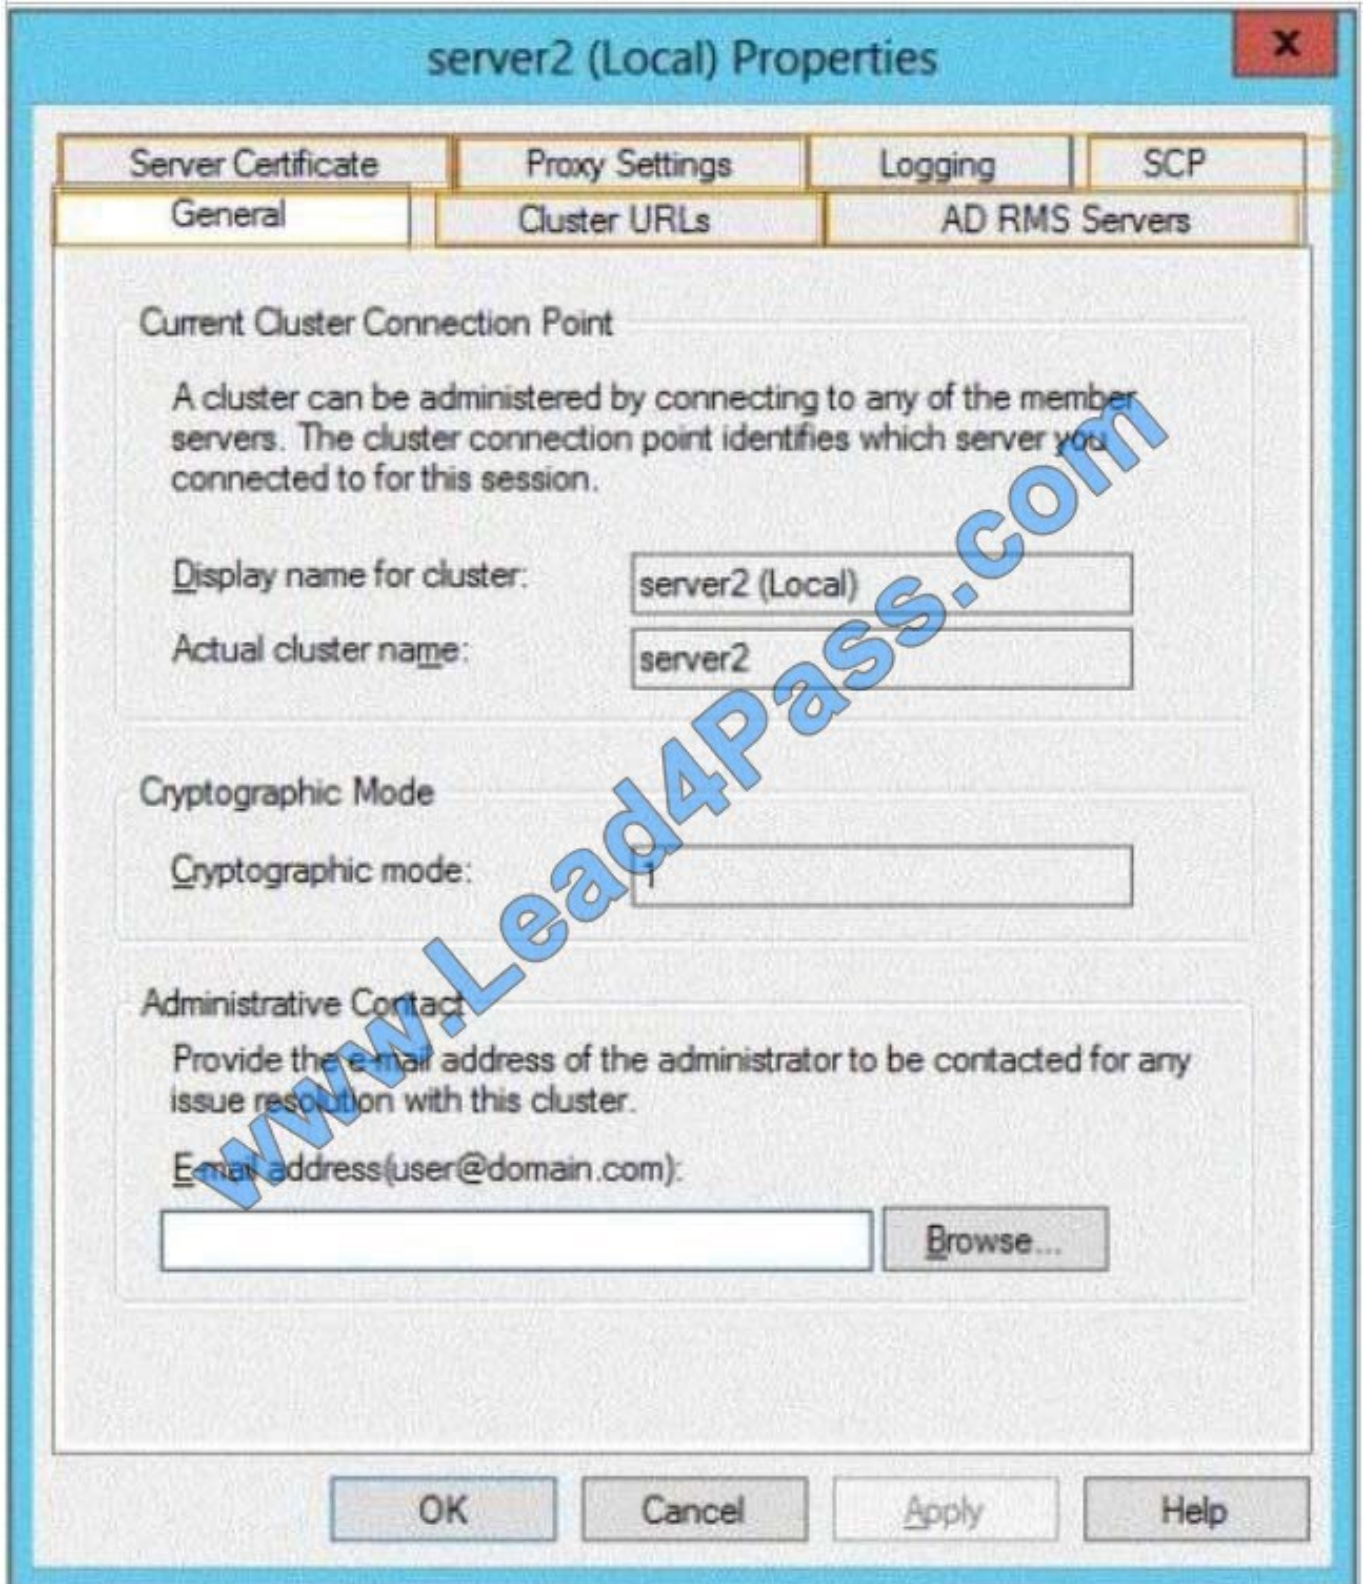

You are a member of the local Administrators group on Server2. You install an Active Directory Rights

Management Services (AD RMS) root cluster on Server2.

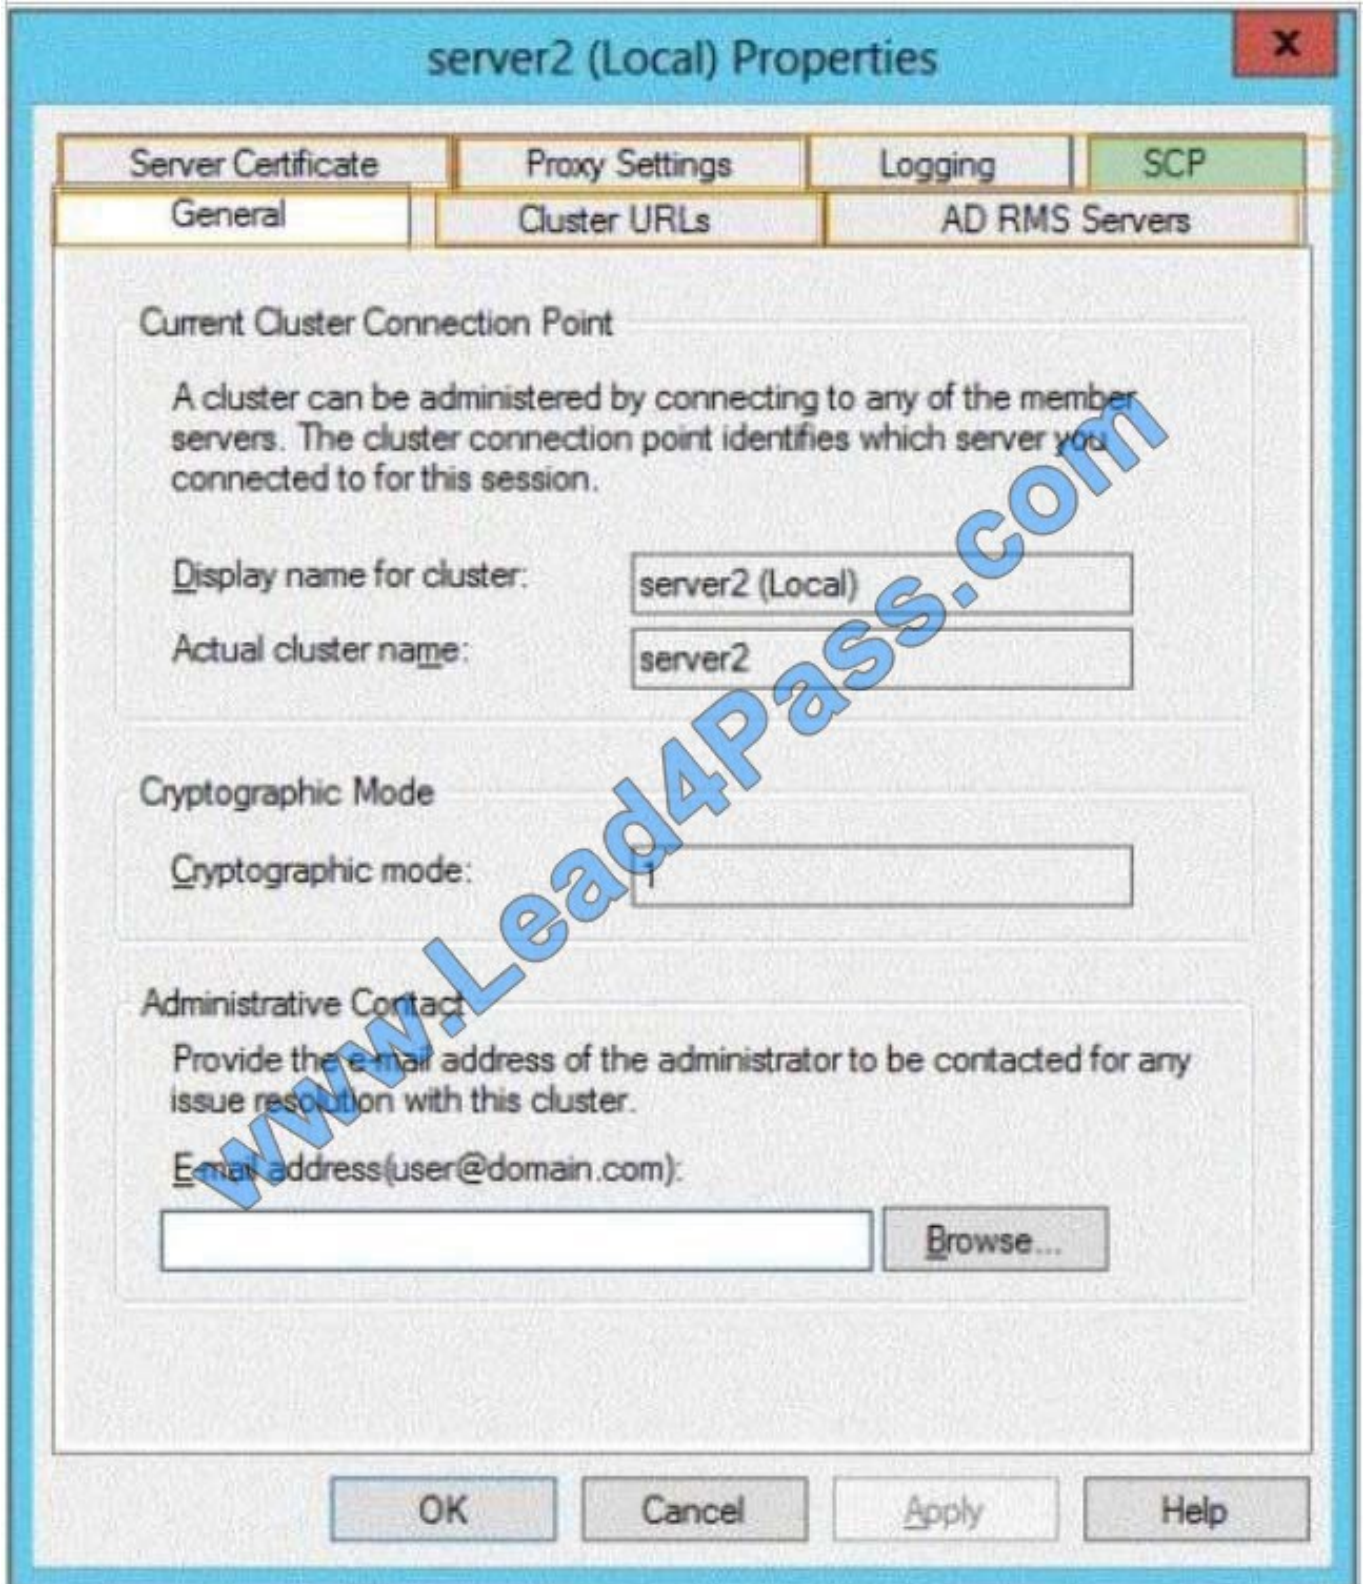

You need to ensure that the AD RMS cluster is discoverable automatically by the AD RMS client computers and the users in contoso.com.

Which additional configuration settings should you configure? To answer, select the appropriate tab in the answer area.

Hot Area:

Correct Answer:

[http://technet.microsoft.com/en-us/library/cc753538\(v=ws.10\).aspx](http://technet.microsoft.com/en-us/library/cc753538(v=ws.10).aspx)

<http://technet.microsoft.com/en-us/library/cc755112.aspx>

QUESTION 2

Your network contains an Active Directory domain named contoso.com. The domain contains a server named Server1 that runs Windows Server 2012 R2. Server1 has the Active Directory Rights Management Services server role installed.

Your company works with a partner organization that does not have its own Active Directory Rights Management Services (AD RMS) implementation.

You need to create a trust policy for the partner organization.

The solution must meet the following requirements:

-Grant users in the partner organization access to protected content

-

Provide users in the partner organization with the ability to create protected content Which type of trust policy should you create?

A.

A federated trust

B.

Windows Live ID

C.

A trusted publishing domain

D.

A trusted user domain

Correct Answer: A

QUESTION 3

Your manager has asked you to configure the company Windows Server 2008 domain controller. He wants all new computer accounts to be placed in the General OU, when computers join the domain. Which command should you use to accomplish this?

A. Netdom

B. Dsmove

C. None of these

D. Redircmp

Correct Answer: D

[http://technet.microsoft.com/en-us/library/cc770619\(v=ws.10\).aspx](http://technet.microsoft.com/en-us/library/cc770619(v=ws.10).aspx)

QUESTION 4

Your network contains a server named Server1 that runs Windows Server 2012 R2. Server1 has the Print and Document Services server role installed. You connect a new print device to the network. The marketing department and the sales department will use the print device.

You need to provide users from both departments with the ability to print to the network print device.

The solution must ensure that if there are multiple documents queued to print, the documents from the sales users print before the documents from the marketing users.

What should you do on Server1?

- A. Add one printer. Modify the printer priority and the security settings.
- B. Add two printers. Modify the priorities of each printer and the security settings of each printer.
- C. Add two printers and configure printer pooling.
- D. Add one printer and configure printer pooling.

Correct Answer: B

http://wiki.answers.com/Q/How_do_you_set_different_print_priority_for_different_users

How do you set different print priority for different users? To set different print priority to different groups Open Printers and Faxes. Right-click the printer you want to set, click Properties, and then click the Advanced tab. In Priority, click the up

or down arrows, and then click OK. Or, type a priority level, where 1 is the lowest level and 99 is the highest, and then click OK.

Click Add Printer to add a second logical printer for the same physical printer. For instructions.

Click the Advanced tab.

In Priority, set a priority higher than that of the first logical printer. Instruct the regular group of users to use the first logical printer name and the group with higher priority to use the second logical printer name. Set the appropriate permissions

for the different groups.

NB:

<http://technet.microsoft.com/en-us/library/cc757086%28v=ws.10%29.aspx>

Creating a printing pool

You can create a printing pool to automatically distribute print jobs to the next available printer. A printing pool is one logical printer connected to multiple printers through multiple ports of the print server. The printer that is idle receives the

next document sent to the logical printer. This is useful in a network with a high volume of printing because it decreases

the time users wait for their documents. A printing pool also simplifies administration because multiple printers can be managed from the same logical printer on a server. With a printing pool created, the user prints a document without having to find out which printer is available. The logical printer checks for an available port and sends documents to ports in

the order that they are added.

Adding the port connected to the fastest printer first ensures that documents are sent to the printer that can print the fastest before they are routed to slower printers in the printing pool. Before setting a printing pool, consider the following:

All printers in a pool must use the same driver.

Because users will not know which printer in the pool prints a given document, make sure all printers in the pool are located in the same place.

QUESTION 5

Your network contains an Active Directory domain named contoso.com. The domain contains six domain controllers named DO, DC2, DC3, DC4, DC5 and DC6. Each domain controller has the DNS Server server role installed and hosts an Active Directory-integrated zone for contoso.com.

You plan to create a new Active Directory-integrated zone named litwareinc.com that will be used for testing.

You need to ensure that the new zone will be available only on DC5 and DC6.

What should you do first?

- A. Create an Active Directory connection object.
- B. Create an Active Directory site link.
- C. Create an application directory partition
- D. Change the zone replication scope.

Correct Answer: C

Zone replication scope: All domain controllers in a specified application directory partition Replicates zone data according to the replication scope of the specified application directory partition. For a zone to be stored in the specified application directory partition, the DNS server hosting the zone must be enlisted in the specified application directory partition. Use this scope when you want zone data to be replicated to domain controllers in multiple domains but you do not want the data to replicate to the entire forest.
